A PROJECT PROFILE  (UPDATED)

PRODUCT : GOLD PLATING ON METALLIC OPTICAL FRAMES

PRODUCT CODE : 344021009

QUALITY STANDARD : AS PER THE CUSTOMER’S SPECIFICATION

PRODUCTION CAPACITY :

     QUANTITY : 6 lakh Nos.
     VALUE : Rs. 2.40 crores

MONTH AND YEAR OF PREPARATION: Feb, 2011

PREPARED BY : Metal Finishing Division
               MSME-DI
               Industrial Estate,
               Nunhai, AGRA- 282006
Introduction: -

The Gold is a relatively scarce yellow metal, often found in the native state, which is the most malleable of all metals. It is extremely corrosion resistant but it may be desolved by aqua-regia, potassium cyanide solution and in aqueous solution of the helogens, bromine and iodine. The metal does not form a coherent oxide film on its surface even at very high temperature and therefore it has very low contact resistant.

First of all the gold plating was practised by the ancient Egyptians, but his was only a thin hammered film on other metals. In the middle ages the process called fire gilding was used to ‘plate’ objects. In this method the article were coated with a mercury/gold amalgam and subsequently heated to drive off the mercury, a layer of pure gold was left. True electroplating of gold dates from the discovery of the double cyanide of gold and potassium about the middle of the 19th Century.

Electroplating of gold is mostly carried out to obtain long lasting decorative finishes and in some cases to improve electric contacts and conductivity. It is deposited from alkaline or acidic solutions, the metal concentration is low because of the high price of gold. The electrolytes are heated to 50 to 70 o C to obtain a reasonable speed of deposition. The cathode efficiency depends upon the metal concentration and the temperature.

The colour of gold deposits depends upon the operating temperature, current density and metal concentration and also on the composition of the electrolyte. Light yellowish coatings are obtained at low current density, low temperature and high metal concentration. A light colour is also obtained by adding nickel salts while red gold is deposited from baths containing copper. The anodes are decomposed of very pure sheet gold or some times insoluble carbon. In the latter case the concentration must be maintained by adding metal salt.

Market Potential:-

There are a large number of applications are available for electroplating units. These are as –

Decorative Uses :- The important uses are in the jewelry, outlery and allied trades, fancy goods such as hand bag frames, powder compacts & costumes jewelry. Thin deposit of pure gold may be applied over bright nickel and this can be more economic where wear resistance is required, e.g. watch cases, pen cases, plumbing fixtures. In all these decorative uses the colour of the gold is a very important feature, ranging from white gold, yellow to rose, red to green golds. Many of these colours are the subject of strict requirement s such as Swiss watch case colour standards.

Industrial Uses:- The most important industrial use of electroplated gold is in the electronic industries, which has grown in the last few years. Because of its unique properties it has become valuable element in the fabrication of micro-electronic devices such as calculators, transistors & diodes. Large items such as heat sinks, headers, wires, springs, connectors, printed circuits often use gold to form or protect the tracks.

Gold electroplating is also being used in many other engineering, aerospace and scientific applications e.g. reflector material in lasers and where the infra red reflectivity is required. Hence the good market is available for this unit.
III. Basis & Presumption:
1. The Project Profile has been prepared on the basis of Single Shift of 8-hrs. a day and 25-working days in a month at 75% efficiency.
2. It is presumed that 1st year, the capacity utilization will be 70% followed by 85% in the next year and 100% in the subsequent year.
3. The rates quoted in respect of salaries and wages for skilled worker and others are on the basis of minimum rates in the State of U.P.
4. Interest rate for the fixed and working capital has been taken @ 12% on an average whether financed by the Bankers or Financial Institutional.
5. The margin money required is minimum (30% of the total capital investment).
6. The rental value for the accommodation of office, workshop and other covered area has been taken @ n.a. per sq. mtr.
7. The rate quoted in respect of machinery, equipment and raw materials are those prevailing at the time of preparation of the Project Profile and are likely to vary from place to place and suppliers to suppliers. When a tailor made project profile is prepared, necessary changes are to be made.
8. The pay back period may be 5-years after the initial gestation period.
9. The gestation period in implementation of the project may be to the tune of 6 to 9 months which includes making all arrangements, completion of all formalities, market surveys and tie-ups etc. Once all the above arrangements are made and quality/standards achieved the 100% project capacity may be achieved at the end of three years. However, a detailed PERT/CPM/chart with implementation period has been given in the report.

IV. Implementation Schedule:
The implementation of the project includes various jobs/exercises such as procurement of technical know how, transfer of technology, market surveys and tie-ups, preparation of project report, selection of site, registration, financing of project, procurement of machinery and raw materials etc., recruitment of staff, erection/commissioning of machines, trial production and commercial production etc. In order to efficiently and successfully implement the project in the shortest period the slack period is curtailed to minimum possible and as far as possible simultaneous exercises are carried out. In view of above a CPM-PERT Chart has been illustrated below, According to which a minimum period of 227 days is involved in finally starting the project on commercial basis. By following this process a time period of 82 days can be saved.

V. Technical Aspect

Manufacturing Process:-

The gold is mainly electro-deposited from Potassium gold cyanide solution which contain a certain minimum quantity of gold.

The articles, which are to be plated first perfectly, cleaned in a suitable hot alkaline soak cleaner and rinsed well. Then pickled and etched the article in the chomic sulphuric acid for 1 to 2 minutes approximately at temperature of 60 to 70 degree C o. Then swill and dry the article. Then polished the article if required and again soak the article in hot, clean and swill well. After the etching the articles are transferred to plating bath, where the gold is deposited from the bath. The following sequence of operation is usually followed for gold plating.
The articles are hanged on the cathode bar of the plating bath where the plating is done. Anode is made of the pure good gold metal (electrode). Then D.C. current between anode and cathode is passed and thereby the plating process is started. The time of plating depends upon the thickness of the coating required. After being nickel plated the article drag out, water swill and the article should be mopped out with suitable mop.

**Preparation of the Bath :-**

To prepare the gold plating bath first clean the PVC lined plating tank with hot die acid and washed out and filled it to one third of its capacity with distilled water. The temperature of the water is raised to 60 o C and the required weight of potassium gold cyanide, caustic potash & potassium sulphite is slowly added. The mixture being stirred well stirred until all the salts are dissolved. Now the bath can be filled up to the required final level and the solution must be purified to remove the traces of the metallic impurities.

Many formulations have been prepared so far for the gold plating. However a typical formulation and operation conditions are given below:-

- **Potassium Cyanide** - 12 grams
- **Potassium Gold Cyanide** - 18 grams
- **Caustic Potash** - 12 grams
- **Potassium sulphite** - 5 grams

One litre distilled water

- **temperature** - 120 o F to 180o F
- **Current density** - 2 – 6 Amp/sq. ft.
- **Volt** - 1.5 – 2 Volts.
Now a day ready-made gold plating salts are available in the market in which the required proportion of the chemicals are mixed. Therefore this salt can also be utilised for the purpose.

Alternate Technology if any:-

Production (Target & Value):-
(a) Quantity (Kgs.) - 6 Lakhs No. of optical frames.
(b) Value - Rs.2,40,00,000/-

Quality Control & Standards:- As per the customer’s specification.

1. Power Requirement: - 7 K.W.H.
   Water Requirement: - K.L./monthly

2. Energy Conservation:-

   The following steps may be taken for the conservation of energy.
   1. Machinery & Equipment’s parts, which are revolving and reciprocating should be properly, lubricated from time to time with suitable lubricant oil.
   2. Lay out of the unit should be in such a way in that no back tracking of material is there.
   3. All electric switches may be kept off, when not required.
   4. The entire transmission belt will be tightened before starting the work is whereever applicable.
   5. Fluorescent tube with electronic Chokes may be used for energy saving. Further recently developed compact fluorescent tubes called (CFT) of 10,15, watts Philips/Glaux made may be used for energy saving and decoration. These self ballasted fluorescent lamps are high efficiency replacements for ordinary bulbs. For same light output, CFLEBs consume about one-fifth the power consumed by ordinary bulbs, thereby saving a lot of energy. The savings get further multiplied when CLEBs are used in air conditioned areas, since the saving of energy by using CLEBs also corresponds to less heat dissipation reducing load on air conditioners. The life of CFLEBs is about 8000/10000 hours i.e. about 10 times that of ordinary bulb.

   The typical payback period in terms of savings of energy bills and cost of ordinary lamps is about 6 months operation. Unlike ordinary bulbs, these CFLEBs provide choice of three colours designated A, B & C, to suit individual requirements.

   Electronic Ballast, with protection against high voltage spikes, along with high quality CFLs make these composite CFLEBs (or self ballasted CFLs) Slim, lightweight, efficient and reliable units.

6. As far as possible Solar Energy and day light will be used keeping all the other lights off.
7. As far as possible inductive load of motor will be reduced and high power factor will be used with the aid of capacitors of appropriate sizes.

7. Pollution Control:-

   1. This industry involves pollution to some extent for which State Pollution Control Board has to be approached.
2. Minimum height of shed will be maintained with exhaust fans should be installed for removing decongestion proper ventilation, removal of cokes fumes etc.

VI. Financial Aspects:-

1. Fixed Capital:-
   Land and Building
   Land 100 Sq. meter @ Rs.300/-Sq. meter 2,00,000
   Build up Area 75 Sq. meter @ 200/-Sq. meter 7,00,000
   Total 9,00,000

2. Machinery and equipment:-

Total Rs. 9,000
(4) Other Expenditure (per month)

1. Postage & Stationary  1,000
2. Advertisement/Publicity  3,000
3. Repairs & Maintenance  3,000
4. Telephone/Fax/Computer  5,000
5. Transportation  2,000
6. Consumable  1,000
7. Insurance  2,000
8. Misc. Expenses  3,000

Total  20,000

II. Total Recurring Expenditure (per month):-

1) Salary & Wages  65,000
2) Raw Material  13,00,000
3) Utilities  9,000
4) Other Contingent Expenses  20,000

Total:  13,94,000

IX. Working Capital for three months:-

= 13,94,000 x 3 = 41,82,000

X. Total Capital Investment:-

Fixed capital:  8,00,000
Working capital (on 3 months Basis)  41,82,000

Total  49,82,000

XI. MACHINERY UTILIZATION:-

It is expected that during first year machine utilization will be 70% and during second year 85% and 100% in subsequent years.

XII. Additional Information if any;

XIII. FINANCIAL ANALYSIS

1. Cost of Production (per annum):-

(a) Total Recurring Cost per year  1,67,28,000
(b) Depreciation on Machinery & Equipment @ 10%  70,000
(c) Depreciation on Office Equipments @ 20%  28,000
(d) Interest on Total Capital Investment @ 12%  5,97,840
(e) Depreciation on Building @ 5% if any  35,000

Total  1,74,58,840
Say  1,74,60,000
XIV. Turn Over per annum:-

</tr>
</tbody>
</table>

Scrap if any

Total

XV. Net Profit per annum before Income Tax :-

\[
2,40,00,000 - 1,74,60,000 = 65,40,000
\]

XVI. Net Profit Ratio:-

\[
\frac{\text{Net profit} \times 100}{\text{Turn over}} = \frac{65,40,000 \times 100}{2,40,00,000} = 27.25\%
\]

XVII. Rate of Return:-

\[
\frac{\text{Net profit} \times 100}{\text{Total investment}} = \frac{65,40,000 \times 100}{49,82,000} = 13.1\%
\]

XIV. BREAK EVEN ANALYSIS: -

(1) Fixed Cost (per annum)

(a) Total Depreciation (on m/c. & equipment, dyies, tools, furniture): 98,000
(b) Depreciation on building @5% 35,000
(c) Interest on borrowing:( Total Investment) 5,97,840
(d) Insurance 24,000
(e) 40% of salary: 3,12,000
(f) 40% of other contingent expenses: 86,400

(Excluding rent & insurance)

Total 11,53,240
Say 11,53,000

XX. Break Even Point

\[
= \frac{\text{Fixed Cost} \times 100}{\text{Fixed cost} + \text{profit}}
\]

\[
= \frac{11,53,000 \times 100}{11,53,000 + 65,40,000} = 14.9\%
\]
